Conductive Bearings

Good conductivity is required for upper side bearings of automotive steering for current grounding in the functioning of horn. Conductive bearing contains a circlip wire which is placed in a groove provided on both rings and is held in place by spring force which will fulfill the requirement of passing the current.

Features

- Provides electrical conductivity
- Specially designed grooves to hold conductive wire
- Specially designed conductive wire

Benefits

- Minimizes electrical pitting
- Improved running life and durability
- No extra space required for wire assembly
- Suitable for oscillation motion
- Increased reliability

Application

- Automotive steering application
